

# SHOOTBACK™ CANNON

Simple and effective: **it shoots back!**

The most effective training for **cover and concealment**

Scenario-activated ShootBack™ is **directly integrated with PRISim®**

Visible laser **helps operators** to aim the cannon

Comes with joystick and video monitor

Can be purchased as a **standalone unit**

## PATENTED SHOOTBACK™ CANNON

With the ultimate tool to raise blood pressure and stress in trainees, the patented PRISim® ShootBack™ cannon forces every trainee to quickly react to situations involving hostile fire, increasing their chances of surviving an encounter out in the field.

## TRAINEES WILL REMEMBER COVER AND CONCEALMENT TECHNIQUES

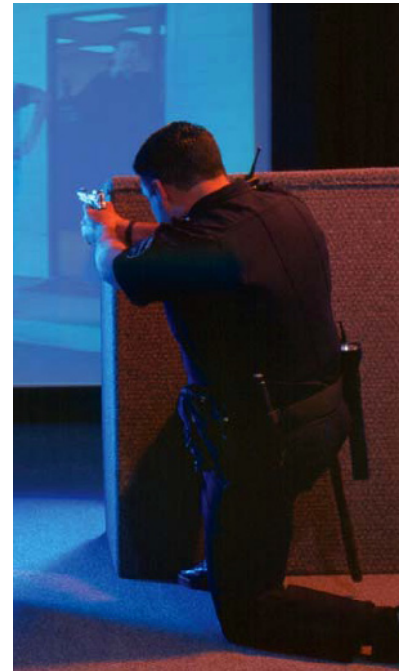

PRISim® ShootBack™ fires a nylon ball from a cannon that is mounted above the centre of the screen, or from the floor-mounted stand.

The ShootBack™ cannon provides a physical reminder of the value and importance of using proper cover when engaged in a fire fight.

The cannon can be set to fire a single shot, a three round burst, or on fully automatic (approximately 7 shots per second).

The cannon is controlled by a joystick. Moving the joystick moves the barrel left, right, up or down. A visible aiming laser helps the operator to aim the cannon at the trainee, and it also provides an additional safety feature as the cannon will not fire when the laser is off.

Use the Scenario Enable button on the joystick to synchronise shots from the cannon with shots fired by the video actors on the screen.

## SHOOTBACK™ COMES WITH:

- Electronics, built-in air compressor, ammunition feed unit, video camera, laser sight and cannon
- Brackets for either wall- or floor-mounting
- Video monitor, displays images from the barrel-mounted video camera
- Joystick
- PRISim® ShootBack™ software to control movement and synchronisation
- 200 nylon balls (more balls can be ordered on request)
- All cables

## STANDALONE SHOOTBACK™

We can provide the PRISim® ShootBack™ cannon as a complete standalone unit, for use with any brand, make or model of simulator. It can even be used in Close Quarters Battle (CQB) buildings and FIBUA facilities as a hostile retaliatory fire device.
