

Target View with 3 Targets

Many indoor shooting ranges contain legacy mechanical targetry systems with very limited control. The mechanics of the target continue to operate, but the computer/electronics/remote control are problematic and can't be repaired. Sound familiar??

AIS have developed a generic targetry control system that is manufacturer neutral. Existing target mechanisms are maintained and a new automated simple control system is included.

Target View with 16 Targets

The TargetMaster software allows moving, pop-up or turning targets to be controlled manually using the mouse or with a simple timer for basic shooting practices. More complex training requirements are catered for in Program Mode where targets are controlled by a scripted sequence which is 'programmed' by the operator and may be saved to hard disk in a library of training sets.

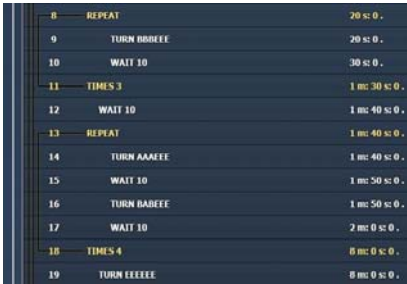

Training sets containing simple target turning sequences can be quickly, and easily created and can be saved for reloading at a later date.

Additional modules may be added to control other functions requiring a toggled 'on-off' control (range lighting, smoke and fog effects, etc) or momentary control (pyrotechnics, sound effects, etc).

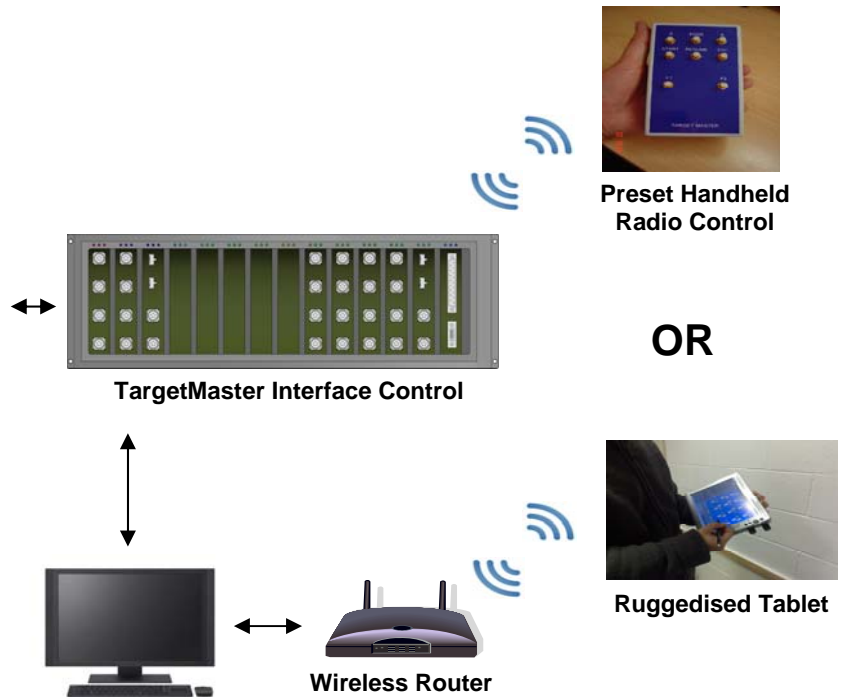

TargetMaster comprises of:

- TargetMaster Control Software
- TargetMaster Interface Module(s)
- TargetMaster Remote Control Tablet/Handheld Controller
