

TETHERED FLOOR BOX WEAPON CONVERSIONS

MACHINE GUN CONVERSIONS

The machine gun floor box standard conversion consists of:

- Modified weapon with laser insert
- Umbilical cable
- Floor box with AIS electronics and air compressor
-

Tethered Floor Box weapons operate on compressed air which provides an unlimited amount of shots. The floor box is permanently submerged in the floor with only plug-in points for air and electronics on the surface.

The weapon has an umbilical tether coming out of the dummy magazine. The other end of umbilical tether plugs into the socket located in the floor box.

The gun is modified with an internal piston fitted inside the barrel. The piston is driven by the compressed air when the trigger is pulled, providing very realistic recoil. The air for the operation of the weapon is generated by a compressor located externally from the training room. The compressed air is fed into the floor boxes.

The machine gun can be cocked and fired as normal, with the standard fire control lever used to select single shot and automatic fire for machine guns.

All AIS tethered floor box conversions are deactivated and carry certification from a UK Proof House.
